QSS is primarily an application software vendor, however sometimes we develop something that other developers find useful.

    - [QSDK](#) . *QSS* Server Developer's   Kit. A toolkit for HP3000 programmers to make it easy to create daemon and   server programs for use in a client/server software architecture.

    - [QWEBS](#) , written by QSS, is a full featured   Web Server designed for the HP3000 and is unique in that it does not require   Posix or HFS support. It was written completely from scratch and is not a   port from existing 'c' based servers. QWEBS is designed to be used by those sites not interested in exploring the depths of Posix and HFS (MPE/iX 5.0),   but who desire to implement a web server using their HP3000 as the host.   Click   [here](#) to visit our   HP e3000 web site served by

[QWEBS](#)
on a Series   A400-100-150.
